API Operations

Welcome to RezPower's API documentation. In this guide you will find all the core operations for RezPower's API. This guide should be a good tool to get you started on working with RezPower's API.

Welcome RezPower's API Documentation

- Web Service Standards and Protocols
- Simple Object Access Protocol (SOAP)

Requesting Rates and Vehicle Availability

Rate Rule Information

Creating a Reservation

Looking up a Confirmed Reservation

Modifying a Reservation

Canceling a Reservation

Looking up Location Details

Searching for a List of Available Locations

Variations on Core Operations

Welcome RezPower's API Documentation

RezPower is a web-based management system for car rental operators that handles daily operational interactions. This guide provides and explains examples for all of the core operations available in RezPower web services.

A web service is a set of functionality that allows two systems to communicate with a common framework. The web services available through RezPower API (application program interface) provide access to all functionality available in RezPower.

Developers should be familiar with XML and the standards to which RezPower adheres. Familiarity with the OpenTravel Alliance (OTA) is also helpful.

The following core operations are standard to an integration with RezPower:

- **VehAvailRate:** Check car class availability and pricing.
- **VehResCancel:** Cancel a specific Reservation.
- **VehLocSearch:** Search for a location by chain, location, or distance, resulting in basic location information.
- **VehRateRule:** Retrieve policy information regarding a particular rate.
- **VehRes:** Complete the booking process, resulting in a confirmed reservation.
- **VehRetRes:** Retrieve a specific Reservation.

The following operations are only available on request:

- **VehResModify:** Modify a specific Reservation.
- **VehLocDetail:** Retrieve location-specific information for filling in your database.
- **ACECityPolicy:** Retrieve location-specific policy information.

Web Service Standards and Protocols

RezPower and its developers follow a series of standards and protocols that keep RezPower in alignment with travel industry standards. Developers who work with RezPower should be aware of the standards listed below.

OpenTravel Alliance (OTA) standards

All schema files in the OpenTravel Alliance specification are made available according to the terms defined by the OpenTravel License Agreement on the OpenTravel documentation page. All API will begin with the prefix "OTA".

Date and time protocol

Please do not include a time zone indicator in any request. RezPower takes into consideration the local time of the location of the operation. RezPower adheres to ISO 8601 Standards.

ISO country code standards

RezPower uses ISO standards for two-digit country codes.

CodeContext

RezPower uses the CodeContext namespace for chaincode identifiers. The chaincode identifier is a two-letter code used across the GDS systems. To specify a particular location, use the two-letter chaincode identifier along with the six-digit GDS location code.

Point of sale (POS) element

For security and consistency purposes, you must use a point of sale (POS) element in all requests that use the appropriate OTA reference code or unique ID type.

Currency

Currency indicators are present in all charge and fee elements under the CurrencyCode attribute. Codes follow OTA specifications.

Simple Object Access Protocol (SOAP)

The ACE Web Service is available in the XML formats for SOAP 1.1 and SOAP 1.2 using the following schema, which can be referenced at http://schemas.xmlsoap.org/soap/envelope.

The following is a sample SOAP 1.1 request and response. The placeholders shown need to be replaced with actual values. ACE uses mostly unwrapped, document-literal formatting.

This is a SOAP 1.1 message example with an HTTP header. The SOAP Action line must be included in SOAP 1.1 messages.

Requesting Rates and Vehicle Availability

This API includes a response for car availability and rates. It covers all rate details, including time and mileage as well as itemized taxes and fees. It can also include special equipment and insurance pricing. Rate plans can include daily, weekend, weekly, and monthly rates, along with extra hours and days.

RezPower will assign a DetailID to all rate requests, which are to be used in the response and the VehRes API. There are multiple rate category codes used by OpenTravel.

VehAvailRateRQ

Rate Rule Information

You can use this API to display the specific rate rules for a previously quoted rate or for a reservation that is already confirmed. You can include a preferred vehicle type and/or additional equipment. When executing the rate rule operation, you will need to include either a confirmation number for a previously confirmed booking or a DetailID from a previous VehAvailRateRQ.

Target element and point of sale (POS): It's important to check the accuracy of both the target and POS elements on this operation and to make sure all elements are consistent across environments and web services. For example, the reference number or the confirmation number you are using within the operation must be obtained from the same RezPower environment and web service to which you are submitting this RQ.

Reference type: The reference type code for a quote will be '16'. The reference type code for a confirmed reservation will be '14'. You will also need to include either the unique identifier for either the quote or the confirmation in the request.

VehRateRuleRS

The response will include:

- The pickup and return date/requirements
- The currency code for the location
- The vehicle description, including mileage per gallon or kilometre per litre
- Rate information for the vehicle, including base rental cost and distance (*if applicable*)
- The total reservation cost, including the sum of the individual charges and associated fees
- Indication whether or not a currency conversion has occurred
- Rules of the rate and/or vehicle (example: *guarantee type*)
- Indication whether or not advanced booking is required and, if so, what the requirements are
- A description of how long the rate will be guaranteed and to which period the rate guarantee applies based on a provisional booking
- The payment rules for a specific vehicle type
- Cancellation policy for the vehicle type and any applicable fees or penalty charges if cancelled outside of the dates within the policy
- The no show policy and applicable fees if not modified or canceled within the no show policy time period
- Reservation deposit requirements and policy
- Maximum rental days to which the rate will apply
- Special equipment and associated charges
- Vehicle coverage and associated charges
- Information for the rental location and drop-off location if different from the pickup location

Creating a Reservation

You can use this API to reserve one or more rental cars using the reference number obtained from an availability request (VehAvailRate).

With this API, you can specify:

- The 6-digit GDS Location code
- The arrival flight information
- A different return location
- The renter's name, address, phone, and email address
- The booking agent and/or source
- A drop-off charge
- A promotion code
- A credit card guarantee
- Additional parameters

A PNR including the customer's name must be included in the request. RezPower will generate a unique confirmation number that should be referenced in all post-reservation RQ/RS's.

Target element and point of sale (POS): It's important to check the accuracy of both the target and POS elements on this operation and to make certain all elements are consistent across environments and web services. the reference number obtained from the VehRateAvailRQ/RS you are using within the operation must be obtained from the same RezPower environment and web service to which you are submitting this RQ.

Modifying a Reservation

You can use this API to modify a confirmed reservation. You can change many elements of a confirmed booking, including:

- Booking agent
- Booking source
- Rate code
- Corporate ID
- Drop off charge
- Promotion code
- Credit card guarantee
- Special equipment
- Miscellaneous information
- Arrival flight information
- Additional parameters

It's important to note that there are two variations on a modification. The first involves modifying customer information or special requests only. The second involves modifying the reservation in such a way that the price may change after the modification is made.

In either case, the UniqueID, or reservation confirmation number must be passed in order to reference the proper record.

```

VehLocDetailRS

The vehicle location detail response will allow car rental providers to return information about the location requested to assist the customer. This information may include:

- Address
- Phone number
- Informational messages
- Parking and counter location
- Services
- Requested location's operating schedule
- A list of vehicles offered at the location
- The requirements in place for renting a vehicle that typically must be met before a rental may commence, such as:
  - License requirements
  - Age requirements
  - Payment options
- Information for:
  - Vehicle renting restrictions like geographic restrictions for vehicle return
  - Additional fees, taxes, and surcharges included in the cost of a rental based on a location and its local laws
  - Financial liabilities assumed by the renter, along with optional coverage to reduce the financial liabilities
  - Services offered at the rental location, either on-location or off-location, that may include the rental of special equipment

Searching for a List of Available Locations

You can use this API to return a full list of available locations based on the latitude and longitude of the location.

You can provide one or more of the following:

- Latitude/longitude
- Address
- Telephone number
- Reference point
- Location code
- and/or radius

The POS ID is required to process the request.

> **Note**: You can call the search function without any of the parameters listed above. If you want to display a list of all available locations, leave the location search criterion field blank.

VehLocSearchRQ

To perform a VehLocSearch, the VehLocSearchCriterion must always be defined. If it is empty, the default behavior will be to perform an all-location search on the AC chain code.

Query Specific Location

```
<VehLocSearchCriterion>
    <CodeRef LocationCode="ATLT01" CodeContext="AC" />
</VehLocSearchCriterion>
```

Query all Chaincode Locations

```
<VehLocSearchCriterion />
<Vendor Code="AC" />
```

- The VehLocSearchCriterion must be present and empty.
- The Vendor element's Code property will be the two-letter chain code (such as "AC").
- The Vendor element's CodeContext property is not currently supported.

Using Both Elements

```
<VehLocSearchCriterion>
    <CodeRef LocationCode="ATLT01" CodeContext="AC" />
</VehLocSearchCriterion>
<Vendor Code="AC" />
```

- Whenever both elements are in use, the chain codes must match.
- This will perform a search for a specific location.

Variations on Core Operations

In some instances, a variation on a core operation may be necessary to produce additional or different results. The primary purposes of the variations are to handle additional requests, products, payment or guarantee types, among others.

For purposes of keeping this document clear and concise, this section contains only the pertinent RQ and RS elements that differentiate the variation from the core operation. The following variations are included in this section:

- **VehAvailRate with inclusive products**: Retrieve rate availability including insurance or other products.
- **VehAvailRate for underage driver**: Retrieve rate availability for a driver who may be underage.
- **VehRateRule with priced coverages**: A rate rule request returning the optional insurance or other products including their respective prices.

Operation: VehAvailRateRQ With Inclusive Pricing

This API includes a response for car availability and rates. It includes all rate details, including time and mileage and itemized taxes and fees, and can include special equipment and insurance pricing. Rate Plans can include daily, weekend, weekly, and monthly rates, along with extra hours and days.

RezPower will assign a DetailID to all rate requests which is to be used in the response and the OTAVehRes API. There are multiple Rate Category codes used by OpenTravel, which can be found in the OpenTravel documentation.

RezPower considers inclusive pricing to be comprised of Time and Mileage, and/or insurance or special equipment, depending on the location. Inclusive rate results can either be calculated using one rate, or a rate including pricing for the ancillary products to be factored into the Estimated Total Price.

The concept of inclusive/exclusive pricing is generally unknown outside of North America. Traditionally, North American pricing has been considered exclusive and only consists of the Time and Mileage (rental rate). In Europe and other markets where international travel is common, most car rental quotes include the necessary insurance or coverage for the renting location.

See below for an example of the RQ element indicating inclusive pricing.

```xml
<?xml version="1.0" encoding="utf-16"?>

Operation: Requesting Optional Insurance or Special Requirement Products and Pricing

This variation should be implemented by networks seeking to offer insurance or special as an add-on during the booking process versus an inclusive rate product. For notes on inclusivve rates, please see the appropriate section of this document.

In order for the VehRateRuleRQ to return the Priced Coverages element, your network must be configured by the RezPower Development team.

Once this is complete, the section will be included on either ReferenceID or ConfirmationID Rate Rule requests. The Priced Coverages element will appear immediately after the Rate Rules element in the schema.

This request will include the PricedEquips element, which will appear after the RateRules element. These Prices are for informational purposes and will be excluded from the Estimated Total Price.

```xml
